

1 Feature: Validate a UAD 3.6 appraisal report package  
2  
3 As a lender, appraisal software provider, or review platform  
4 I want to submit a UAD 3.6 appraisal report package for validation  
5 So that I can identify specification, mapping, and rule compliance issues before delivery  
6  
7 Background:  
8 Given the UAD 3.6 schema model has been loaded  
9 And Appendix A mapping and XLink requirements have been loaded  
10 And Appendix H validation rules have been loaded  
11  
12 Scenario: Validate XML structure  
13 Given a UAD 3.6 appraisal XML report package  
14 When the client submits the package to the validation API  
15 Then the service validates the XML against the GSE trimmed schema  
16 And the response identifies structural validation errors  
17 And each structural error identifies the affected XML location  
18 And each structural error identifies the governing schema component  
19  
20 Scenario: Convert XML instance nodes to graph resources  
21 Given a structurally readable UAD 3.6 appraisal XML report package  
22 When the service processes the package  
23 Then each addressable XML instance node is represented as a graph resource  
24 And each graph resource has a stable IRI  
25 And each graph resource retains its source XML location  
26 And XML IDs are preserved when present  
27  
28 Scenario: Validate XLink relationships  
29 Given a UAD 3.6 appraisal XML report package containing XLink relationships  
30 When the service evaluates Appendix A mapping requirements  
31 Then each XLink subject is resolved to a graph resource IRI  
32 And each XLink object is resolved to a graph resource IRI  
33 And each XLink predicate is resolved to a governed predicate IRI  
34 And invalid, missing, or disallowed relationships are reported as findings  
35  
36 Scenario: Validate controlled values and datatypes  
37 Given a UAD 3.6 appraisal XML report package  
38 When the service evaluates schema validation elements  
39 Then datatype violations are reported as findings  
40 And enumeration violations are reported as findings  
41 And each finding identifies the observed value  
42 And each finding identifies the expected datatype or controlled value set  
43  
44 Scenario: Validate Appendix H rules  
45 Given a UAD 3.6 appraisal XML report package  
46 When the service evaluates Appendix H rules  
47 Then each applicable rule is evaluated  
48 And failed rules are reported as findings  
49 And each finding identifies the rule identifier  
50 And each finding identifies the affected XML or graph resource location  
51 And each finding identifies whether the rule applies to Fannie Mae, Freddie Mac, or both  
52  
53 Scenario: Apply both GSE rule sets by default  
54 Given a UAD 3.6 appraisal XML report package  
55 And the client does not specify the loan delivery GSE  
56 When the client submits the package to the validation API  
57 Then the service evaluates both Fannie Mae and Freddie Mac requirements  
58 And the response distinguishes Fannie-only, Freddie-only, and shared findings  
59
