Hi,

As discussed:

We are seeing misses in the implementation of UAD 3.6 appraisal software due to not properly or fully applying the GSE UAD 3.6 Specifications.

Exasperating the situation, large lenders are construing Fannie Mae SB4-1.3.12 policy as any concerns that they find when the appraisal report as delivered to them is being remedied with required corrective revisions and corresponding revision history for any and all "errors", regardless of whether the problem is affecting value. The Revision History Detail is freeform text so there is only so much automation that can be deployed to check it.

Since it is usually not known at the time of appraisal where the loan it is associated will be delivered to, both GSE policies have to be applied to satisfy the lender client's requirements. And, while hopefully these problems get addressed quickly by the source software, it happens to touch the majority of the appraisal volume in the market presently.

Here is the opportunity:

(Materials referenced found here: [Uniform Appraisal Dataset | Fannie Mae](#))

1. Convert the published GSE trimmed schema to Graph DB (Attached)
2. Apply mapping details such as XLink requirements from specification (Appendix A)
3. Convert schema validation elements (enums, data types) and rules (Appendix H) Skois/OLLAM
4. Stand up as a backend service accessible via API
