

Feature: Ingest UAD 3.6 specification assets

As a compliance service operator

I want to ingest the GSE trimmed UAD 3.6 schema and related specification details

So that the validation service is based on governed, versioned source material

Background:

Given the service supports UAD 3.6

And stable IRIs can be minted for UAD schema components, XML instance nodes, predicates, and validation rules

Scenario: Load the GSE trimmed schema into the graph store

Given a published GSE trimmed UAD 3.6 schema file

When the schema ingestion process runs

Then schema elements are represented as graph resources

And schema datatypes are represented as graph resources

And schema enumerations are represented as controlled values

And each schema component has a stable IRI

And the source schema version is recorded

Scenario: Load Appendix A mapping and XLink requirements

Given the UAD 3.6 Appendix A mapping details

When the mapping ingestion process runs

Then XLink relationship requirements are represented as graph predicates

And allowed subject and object resource types are recorded

And each relationship predicate has a stable IRI

And each mapping rule is traceable to its source location

Scenario: Load Appendix H rules

Given the UAD 3.6 Appendix H rules

When the rule ingestion process runs

Then each rule is represented as a validation rule resource

And each rule has a stable rule identifier

And each rule records its severity

And each rule records whether it applies to Fannie Mae, Freddie Mac, or both

And each rule is traceable to its source location

Scenario: Preserve source provenance

Given any ingested schema component, mapping rule, value set, or validation rule

When the resource is queried

Then the response includes the source document name

And the source version

And the source section or appendix reference

And the ingestion timestamp
